

```
#Test script for workshop
```

Initialize

```
library(knitr)
#knitr::spin("test.r")
library(dae)
packageVersion("dae")
```

```
## [1] '3.2.26'
```

```
library(odw)
packageVersion("odw")
```

```
## [1] '2.1.4'
```

```
b <- 5
t <- 5
```

Construct a systematic layout and obtain the randomized layout for an RCBD

```
RCBD.sys <- cbind(fac.gen(list(Rows=b, Columns=t)),
                  fac.gen(generate = list(Lines = LETTERS[1:t]), times = b))
RCBD.lay <- designRandomize(allocated = RCBD.sys["Lines"],
                           recipient  = RCBD.sys[c("Rows", "Columns")],
                           nested.recipients = list(Columns = "Rows"),
                           seed = 1134)
```

Plot the layout

```
designGGPlot(RCBD.lay, labels = "Lines", cellalpha = 0.75,
             axis.text.size = 20, label.size = 8,
             blockdefinition = cbind(1,t))
```

Get the anatomy of the layout

```
RCBD.canon <- designAnatomy(formulae = list(plots = ~ Rows/Columns,
                                             lines = ~ Lines),
                             data = RCBD.lay)
summary(RCBD.canon)
```

```
##
##
## Summary table of the decomposition for plots & lines
##

Use odw to get an optimal row-column design

```
RC.odw <- odw (fixed = ~ Rows + Columns,  
              residual = ~ Rows:Columns,  
              permute = ~ Lines, maxit = 500,  
              data = RCBD.lay)  
  
## Thu May 23 23:51:26 2024  
## Initial criterion = 0.496091 (5 A-equations; rank C 4)  
## Final criterion after 500 iterations: 0.438095  
## Cleaning up: Thu May 23 23:51:26 2024  
RC.lay <- RC.odw$design
```

Plot the layout

```
designGGPlot(RC.lay, labels = "Lines", cellalpha = 0.75,  
            axis.text.size = 20, label.size = 8)
```
